

Hamilton Sorter Custom Capabilities

Butler County Treasurer's Office

Transaction stations for customer service feature cantilevered counters with anti-bacterial Marmoleum surfaces and impact resistant edge banding for durability. Framed, tempered glass windows separate customers and staff.

Workstation is precisely sized to maximize space utilization.

The Butler County Treasurer's Office is a facility where employees constantly interact with the public. It's an environment that requires ergonomic furniture for people and accessible support for the latest technology. Contemplating a proposed facility redesign, Mary Jane Vastola, Teller Supervisor, identified a number of specific issues that needed to be addressed, including an existing work environment that was inefficient and aesthetically dreary, a lack of storage space and employee complaints of muscle fatigue due to awkward placement of technology. In addition there was an ongoing concern that transaction stations, where employees frequently handled money, were breeding grounds for bacteria and transmittable diseases.

Doug Stitzel of Hamilton Office Interiors had a long relationship with Butler County, assisting in the design and implementation of many of their facility requirements. Working with Hamilton Sorter's Technical Services support team he was able to meet the creative challenges of the Treasurer's Office redesign. Hamilton's Custom Capabilities program is based on their unique modular millwork manufacturing systems. Starting with standard components, Hamilton can cost-effectively create the modifications and custom features that meet a specific project's requirements.

Hamilton's storage solutions include modular wall-hung cabinets, file pedestals and accommodation for special cash drawers.

Workstations are designed for efficient work flow and transaction privacy.

Marmoleum, a biodegradable and anti-bacterial surface that kills and prevents the growth of bacteria, was proposed by Hamilton Sorter for the transaction station tops. Its long wearing, self-healing surface is ideal for high traffic activity and resists minor scratches and blemishes.

From Marmoleum surfaces, tempered glass windows, the accommodation of special cash drawers and special connectivity panels for power, data and telephone lines, Hamilton was able to produce a solution with all the advantages of custom millwork, but with the price economies of standard furniture.

Toe base molding creates a protective finishing touch to transaction station bases.

Hamilton's comprehensive solution transformed a cramped work environment into an attractive, smoothly functioning space. Responding to the new suite of transaction stations, Mary Jane Vastola commented "They are beautiful, we definitely like what we got."
