FormFlo Vacuum Forming Web Improves Speed to Market

Stanley, WI, November 1st, 2011 – Forming webs are an increasingly popular design option for the form/fill/seal of packaging components and finished products in medical, industrial and consumer product applications.

The Film Tech, LLC line of FormFlo forming webs has been proven and optimized over the course of the last six years for non-barrier applications on popular horizontal lines that can be paired with customer specified printed top webs or paper for sterilized packages. The FormFlo films provide brand security, confidence in product integrity and ultimately confidence in the packaged product at the end-user level.

“Being able to provide a down-gauged forming film for applications in a variety of widths and volume levels has improved the speed to market in new product launches”, according to a packaging engineer at an established medical device innovator. “We constantly strive to improve our packaging functionality and appearance, but it is the consistent performance during the packaging process that sets the Film Tech webs apart”.

Available in a variety of gauges from 5 mil (0.005”) to 16 mil (0.016”), each web is specified to meet the draw depth requirements and equipment features available. Pre-heat, plug assist, and well depth and geometry all impact the film design and the flow of the custom blended polymers used. Our Film Tech team will work with the equipment vendor of choice to drive total cost of ownership improvements.
